

## ADDENDUM

THE MEDICAL JOURNAL OF MALAYSIA Vol. XXXI No. 2 December 1976

ARTICLE: THE SURGICAL MANAGEMENT OF PTOSIS by Andrew C.H. Fong

*Page 145: Lines 7 to 10 is inserted out of place: they should follow the bottom line of the column. Line 6 should continue to line 11.*

### **CORRECTED VERSION**

*From line 5: (page 145)*

In Chinese patients with unilateral ptosis and absent lid fold on the contralateral lid, it is necessary to use the posterior approach to avoid creating an unwanted lid fold.

*From line 20 (page 145)*

For severe unilateral or bilateral congenital ptosis with levator function of 4 mm or less, levator resection is still the operation of choice. If this fails, a suspension operation is done as a second procedure. Beard (1969) advised bilateral suspension operation as a primary procedure for severe bilateral congenital ptosis if the patient is reluctant to undergo a second operation.
